Those marked thus (*) are what is usually termed tender or *green-house* kinds, though the tenderest kinds will stand the winter of this climate in the open ground, if only protected with a hot-bed frame and tight shutters, from the beginning of December until the beginning of March, so as to keep off the snow and shelter them from the cutting

winds; and if in addition to the shutters, the sashes which are not used during this season of the year could be put on the frames so much the better, this little trouble will be amply repaid by the forwarding of the plants, which will bloom three or four weeks sooner in spring, than if taken up in pots and kept in a good frame and well covered. The trouble taken in putting the frames over the plants and giving them air four or five times in the course of winter, (if however the weather permits, for if constantly dry and cold they will want none,) will be saved in not taking up the plants, which operation checks considerably their growth in spring when turned out of the pots.
